-i- FUNCTION: Likely to represent a widespread endoprotease activity within the constitutive and regulated secretory pathway. Capable of cleavage at the RX(K/R)R consensus motif. May be responsible for the maturation of gastrointestinal peptides. May be involved in the cellular proliferation of adrenal cortex via the activation of growth factors.
                                                                                                                                                                                                                                                                   of growth factors.

TATALYTIC ACTIVITY: Release of mature proteins from their proproteins by cleavage of Arg-Kaa-Yaa-ARG-|-Zaa bonds, where Kaa can be any amino acid and Yaa is Arg or Lys.

SUBCELLUIAL ROCATION: PC5A IS SECRETED THROUGH THE REGULATED SECRETORY PATHMAY. PC5B IS A TYPE I MERBAND PROTEIN LOCALIZED TO A PARANUCLEAR POST-GOLGI NETWORK COMPARTMENT IN COMMUNICATION WITH
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      DOWAIN: AC 1 and AC 2 (clusters of acidic amino acids) contain sorting information. AC 1 directs TGN localization and interacts with the TGN sorting protein PACS-1.

SIMILARITY: Belongs to peptidase family S8.
SIMILARITY: Contains 1 homo B/P domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                         Event=Alternative splicing; Named isoforms=2;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Bvent=Alternative splicing; Named isoforms=3;

    -!- SIMILARITY: Belongs to peptidase family S8.
    -!- SIMILARITY: Contains 1 homo B/P domain.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Pfam; PP01483; Pproprotein; I. constitutive secretory pathway, with unique restricted
constitutive secretory pathway, with unique restricted
distribution in both neuroendocrine and non-neuroendocrine tissues
and capable of cleavage at the RK(R)R consensus motif.

-I- CATALYTIC ACTIVITY: Release of mature proteins from their
proproteins by cleavage of Arg-Kaa-RAG-|-Zaa bonds, where Xaa
can be any amino acid and Yaa is Arg or Lys.
-I- COPACTOR: Calcium (Potential).
-I- COPACTOR: Calcium (Potential).
-I- COPACTOR: Calcium (Potential).
-I- COPACTOR: Calcium (Potential).
-I- SUBUNIT: The PACEAA-I precursor protein seems to exist in the
reticulum endoplasmic as both a monomer, suggesting that
propeptide cleavage affects its tertiary or quaternary structure.
-I- SUBCELLUAR LOCATION: PACEAA-I and PACEAI are secreted. PACEAC
and PACEACS are not secreted and remain probably in zymogen form
in endoplasmic reticulum. PACEAR-I and PACEAB-II are retained
intracellularly probably through a hydrophobic cluster in their C-
terminus. PACEAB might be secreted.

Isold=VSR SPECIFICITY: Each PACEGA-I is expressed in heart, brain, placenta, lung, skeletal muscle, kidney, pancreas, but at comparatively higher levels in the liver. PACEA-II is at least expressed in placenta. PACEAB was only found in the embryonic kidney cell line from which it was isolated. PACEAC and PACEAD are expressed in placenta. PACEAB-II is expressed in cerebellum, placenta and pituitary. PACEAB-II is at least present in
                                                                                                                                cerebellum.
--- DOMAIN: The propeptide domain acts as an intramolecular chaperone assisting the folding of the zymogen within the endoplasmic reticulum. Isoform PACB4D lacks the propeptide domain.
--- SIMILARITY: Belongs to peptidase family $8.
--- SIMILARITY: Contains 1 homo B/P domain.
                                                                                                                                                                                                                                                  bu.

Dev. Biol. 181:268-283(1997).

-I- FUNCTION: Likely to represent a widespread endoprotease activity
-i- FUNCTION: Likely to represent a widespread endoprotease activity
within the constitutive and regulated secretory pathway. Capable
of cleavage at the RX(K/R)R consensus motif. May be responsible
for the maturation of gastrointestinal peptides. May be involved
in the callular proliferation of adrenal cortex via the activation
of growth factors.
-i- CATALYTIC ACTIVITY: Release of mature proteins from their
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           DOWAIN. AC 1 and AC 2 (clusters of acidic amino acids) contain sorting information. AC 1 directs TGN localization and interacts with the TGN sorting protein PACS-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         R InterPro; IPR006212; Purin repeat.

PROPROTEIN CONVERTASE SUBTILISIN/KEXIN

THE S.
Reudelhuber T.L.;
Submitted (FRB-1996) to the EWBL/GenBank/DDBJ databases.

-!- FUNCTION: Likely to represent a widespread endoprotease activity
within the constitutive and regulated secretory pathway. Capable
of Cleavage at the RX(K/R)R consensus motif.

-!- CATALYTIC ACTIVITY: Release of mature proteins from their
proproteins by cleavage of Arg-Xaa-Yaa-ARG-|-Zaa bonds, where Xaa
can be any maino acid and Yaa is Arg or Lys.
-!- SUBCELLULAR LOCATION: Secreted (By similarity).
                                                                                                                                                                                 IsoId=Q92824-1; Sequence=Displayed; TISSUE SPECIFICITY: Expressed in T-lymphocytes. DOWANTS: The propeptide domain acts as an intramolecular chaperone assisting the folding of the zymogen within the endoplasmic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CELL ATTACHMENT SITE (POTENTIAL).

-I- FUNCTION: Binds to WNT proteins and inhibits their activities. May be involved in mesoderm segmentation.

-I- SUBCELLULAR LOCATION: Secreted.

-I- TISSUR SPECIFICITY: During somatogenesis, expressed predominantly in unsegmented paraxial presomitic mesoderm and, to a much lesser extent, in newly segmented somites.

-I- DEVELOPMENTAL STAGE: First expressed at neurula stages.

-I- SIMILARITY: Contains 1 WIF domains.

"Scropic neural expression of a floor plate marker in frog embryos injected with the midline transcription factor Pintallavis.";
Proc. Natl. Acad. Sci. U.S.A. 90:8588-8272(1993).
-I- FUNCTION: Promotes the attachment of spinal cord and sensory neuron cells and the outgrowth of neurites in vitro. May contribute to the growth and guidance of axons in both the spinal cord and the PNS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                -1- SUBCELLULAR LOCATION: Secreted.
-1- TISSUE SPECIFICITY: Expressed at high levels in the floor plate.
-1- SIMILARITY: Contains 6 TSP type-1 domains.
                                                                                                                                                                                                                                                                                                            Xenopus laevis (African clawed frog).

C. !- DBVBLOPMENTAL STAGE: Expressed in the embryonic ventricular zone, the postnatal ependymal cells, and the choroid plexus throughout embryonic and postnatal development.

C. !- PTM: Synthesized in the endoplasmic reticulum as an inactive form which is proteolytically cleaved by a furin-like convertage in the trans-Golgi network before it reaches the plasma membrane to yield an active, ligand-accessible form. Cleavage results in a C. terminal fragment N(TW) and a N-terminal fragment N(BC). Following ligand binding, it is cleaved by TNF-alpha converting enzyme (TACE) to yield a membrane associated intermediate fragment called notch extracellular truncation (NEXT). This fragment is then cleaved by presentlin dependent gamma-secretase to release a notch-derived peptide containing the intracellular domain (NICD) from the membrane.

C. !- STMILARITY: Contains 35 ESF-like domains.

C. !- SIMILARITY: Contains 2 Lin/Notch repeats.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This SWISS-PROT entry is copyright. T. Conservation of the biochemical mechanisms of signal transduction of roces of the biochemical mechanisms of signal transduction of among mammalian Norch family members.;
T. PUNCTION: Functions as a receptor for membrane-bound ligands of Jagged1, Jagged2 and Deltal to regulate cell-fate determination. Upon ligand activation through the released notch intracellular domain (NAIC) it forms a transcriptional activator complex with RB-J kappa and activates genes of the enhancer of split locus.

X. Affects the implementation of differentiation, proliferation and appotence in postimplementation of differentiation, proliferation and appotence of a Similarity). May play an essential role in specification and/or differentiation.

X. SUBUNIT: Heterodimer of a C-terminal fragment N(TM) and a N-terminal fragment N(EC) which are probably linked by disulfide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Name=2;

SUBUNIT: TETRARER OF 2 ALPHA AND 2 BETA CHAINS LINKED BY DISULFIDE BONDS. THE ALPHA CHAINS CONTRIBUTE TO THE FORMATION OF THE LIGAND-BINDING DOMAIN, WHILE THE BETA CHAIN CARRIES THE KINASE DOMAIN.
SUBCELLULAR LOCATION: Type I membrane protein.
SIMILARITY: Belongs to the Tyr family of protein kinases. Insulin receptor subfamily.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Bukaryota; Metazoa; Chordata; Craniata; Vertebrata; Buteleostomi;

-!- DEWELOPWENTAL STAGE: Expressed in the brain during E14 and E17.
-!- PTM: Synthesized in the endoplasmic retlculum as an inactive form which is proteolytically cleaved by a furin-like convertace in the trans-Golgi network before it reaches the plasma membrane to yield an active, ligand-accessible form. Cleavage results in a Cterminal fragment N(TM) and a N-terminal fragment N(EC). Following ligand binding, it is cleaved by TNF-alpha converting enzyme (TACE) to yield a membrane-associated intermediate fragment called notch extracellular truncation (WEXT). This fragment is then cleaved by presentlin dependent gamma-secretase to release a notch-derived peptide containing the intracellular domain (NICD) from the membrane [P8 similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This SWISS-PROT entry is copyright. development, probably in some aspect of cell specification and/or differentiation (By similarity).

SUBSUNIT: Heterodimer of a C-terminal fragment N(TM) and a N-terminal fragment N(EC) which are probably linked by disulfide bonds (By similarity).

SUBSCELLULAR PLOCATION: Type I membrane protein. Following proteclytical processing NICD is translocated to the nucleus. TISSUE SPECIFICITY: Highly expressed in the spleen and choroid plexus in the brain. Expressed in postnatal central nervous system (CNS) germinal zones and, in early postnatal life, within numerous cells throughout the CNS. It is more highly localized to ventricular germinal zones. Also found in the heart, liver and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 POTENTIAL.

SIMILARITY: Belongs to the NOTCH family.
SIMILARITY: Contains 35 EGF-like domains.
SIMILARITY: Contains 2 Lin/Notch repeats.
SIMILARITY: Contains 6 ANK repeats.

"Mutational analysis of bli-4/kpc-4 reveals critical residues required for propriotal convertase function in C. elegans.";
Gene 252:15-25(2000).
-!- FUNCTION: The Kex2/subtilisin-like proteinase activity of this enzyme is required for the normal production of adult cuticle.
There is functional redundancy between the isoforms. Vital for embryonic and larval development.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Note-No experimental confirmation available:
--- TISSUE SPECIFICITY: In larvae and adults, expressed in all hypodermal cells, vulva and ventral nerve cords.
--- DEVELOPMENTAL STAGE: Expression starts at embryo two-fold stage through to adults.
--- SIMILARITY: Belongs to peptidase family SB. Furin subfamily.
--- CAUTION: Ref.1 sequence differs from that shown due to a frameshift in position 651.
--- CAUTION: Ref.2 (AAB96754 and AAB96757) sequence differs from that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       MEROPS; SOB.031; -...
